Rhinosinusitis with Nasal Polyposis

With a foreword by D.W. Kennedy (Philadelphia, Pa.)

Karger Medical and Scientific Publishers Chronic rhinosinusitis with nasal polyposis (CRSwNP) is a heterogeneous disease that impacts a significant portion of the population. Specific subtypes of the disease include cystic fibrosis, allergic fungal sinusitis, and aspirin-exacerbated respiratory disease. Unfortunately, the majority of patients with CRSwNP do not fall within one of these subtypes, and have variable responses to medical and surgical treatment. There are rapidly evolving theories describing the etiology of CRSwNP that involve alterations in innate immunity, acquired dysfunction of respiratory epithelial cells, and external or environmental factors. This book provides a comprehensive update on the latest theories on the etiology of CRSwNP as well as a review of innovative and effective medical and surgical therapies. Special thanks go to D.W. Kennedy, Philadelphia, Pa., for contributing the foreword. Otorhinolaryngologists and allergologists, as well as other physicians and medical providers treating patients with CRSwNP, will find this volume to be an indispensable source of current information.

Invasive Fungal Rhinosinusitis

Springer Science & Business Media Incidence of invasive fungal sinusitis has been increasing over the years. The understanding of its pathophysiology has improved with newer serological tests and diagnostic methods helping in earlier diagnosis and reducing patient morbidity. It was believed earlier that invasive fungal sinusitis is seen only in immune compromised patients but clinical reports suggest otherwise. More anti-fungal drugs are being added to improve incidence of patient survival. This book aims to compile all practical information about invasive fungal sinusitis into a single volume. Therefore, busy clinicians would not have to perform exhaustive literature studies to diagnose invasive fungal sinusitis. The book aims to provide an overview of diseases which could be mistaken for invasive fungal sinusitis and discuss how the management is different. Book sections consist of clinical, microbiological, serological, pathological, radiological and pharmacological features of the disease and its management. Each section is important in today's context as it dynamically alters the management of the patient. Early clinical suspicion and rapid microbiological, pathological and radiological diagnosis with aggressive treatment with surgical debridement and medical therapy leads to favorable outcomes.

How Tobacco Smoke Causes Disease

The Biology and Behavioral Basis for Smoking-attributable Disease : a Report of the Surgeon General

U.S. Government Printing Office This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

WHO Guidelines for Indoor Air Quality

Dampness and Mould

WHO Regional Office Europe Microbial pollution is a key element of indoor air pollution. It is caused by hundreds of species of bacteria and fungi, in particular filamentous fungi (mould), growing indoors when sufficient moisture is available. This document provides a comprehensive review of the scientific evidence on health problems associated with building moisture and biological agents. The review concludes that the most important effects are increased prevalences of respiratory symptoms, allergies and asthma as well as perturbation of the immunological system. The document also summarizes the available information on the conditions that determine the presence of mould and measures to control their growth indoors. WHO guidelines for protecting public health are formulated on the basis of the review. The most important means for avoiding adverse health effects is the prevention (or minimization) of persistent dampness and microbial growth on interior surfaces and in building structures. [Ed.]
